خلاصه مقاله:

This study developed a model to explain the relationship between quality of attachment to God and marital conflicts through religious coping. For this purpose, the Muslim married students who were studying in the Al-Mustafa International University, Mashhad, were invited to participate in the study. Finally, 21 women and 22 men voluntarily enrolled and filled the M-SAS, the brief RCOPE (Pargament) and GRIMS. The results were analyzed by using structural equation modelling using partial least square and the software Smart PLS. The results showed a significant relationship ($p < 0.05$) between secure attachment to God and marital conflicts through positive religious coping ($t = 7.89$) and secure attachment to God and marital conflicts ($t = 2.46$). Secure attachment to God could predict variations in marital conflicts. Moreover, there was a significant relationship ($p < 0.05$) between avoidant attachment to God and marital conflicts ($t = 3.96$); the avoidant attachment to God could predict 20% variance in marital conflicts ($p < 0.05$). However, there was no significant relationship ($p < 0.05$) between anxious attachment to God and marital conflicts and negative religious coping did not mediate the relationship between quality of attachment to God and marital conflicts ($p < 0.05$). Therefore, the model could explain the relationship between secure attachment to God through positive religious coping and avoidant attachment to God and marital conflicts.

کلمات کلیدی:

Attachment To God, Marital Conflicts, Positive Religious Coping, Negative Religious Coping
