## خلاصه مقاله:

Foreign body aspiration may cause airway obstruction, either partial or total, which can be life-threatening. Delayed diagnosis will increase patient morbidity, especially the occurrence of bacterial infections. This case report discusses chronic foreign body aspiration in a six year-old boy, in which signs and symptoms arise 4 years after foreign body aspiration occurred. The boy was the second child of the family. He came from a Sundanese family, considered as low income family, and the parents were high school graduates

## کلمات کلیدی:

Aspiration, Chronic, Foreign body
