خلاصه مقاله:

The impact of the environment on children's mental and physical health is an important subject for researchers and activists in the field of children. Given that the child spends a lot of time in kindergarten and away from the family, it is important to pay attention to how the child interacts with the designed environment and its quality. In this study, the resources available in the field of architecture and environmental psychology for children examined. It was found that factors such as light, nature, window, color affect children's self-confidence, calmness, and concentration. Also, designing a play environment in a multi-usage way along with these factors, allows the child to cultivate their creativity and social ability. By improving the level of health and creativity of children, the behavior of the future society will be formed and the level of mental health of the society will be improved. Also, by designing an environment that has close relations with nature, a sense of commitment to nature will be created in the children.
