خلاصه مقاله:

Introduction: Air pollution is now one of the greatest environmental hazards to human health in the world. The aim of this study determines the relationship between air quality and cases of myocardial infarction in Yazd. Methods: This Ecological study was performed in Yazd, Iran. In this study, all individuals who referred to emergency cases with myocardial infarction in Yazd in one year from Yo1F march Yo to Yo1Y March Yo entered the study. Information on daily concentration of air pollutants, including five pollutants SOY, CO, OW, NOY and PMIo and Validated according to the World Health Criteria. And in the next step Raw data from air pollutants related to each station. Using equation and table standard Converts to separate AQI values for each pollutant And the pollutant having the highest index It was introduced as a pollutant responsible for the day. The data analyzes were used by Excel YooV and R (W.F.W) software. The significant level was considered to be less than o.oa. Results: According to measurements of air pollutants, FF9 days in YFA days, the standard air quality index (AQI < 100) and 10F days a year above the standard standard (AQI> 100) were observed In A۶ days, from ۱۰۴ days PM1. and CO emissions as pollutants was responsible for introducing. Conclusion: Given that in 1.9F days of the year, air quality has exceeded the standard In the days when air quality .exceeds the standard, children and elderly take caution

کلمات کلیدی: Air Pollutants, Myocardial Infarction, Air Quality Index (AQI), Yazd, آلودگی هوا, سکته قلبی, شاخص کیفیت هوا, یزد
