### خلاصه مقاله:

The new report on the Persian gecko is based on one adult male and two adult females from Qasr-e-Shirin, Kermanshah Province. This is the most western point of distribution recorded for *Hemidactylus persicus* Anderson, 1872. The collected specimens were examined based on metric, meristic, and pholidotic characters. These were larger than previously measured specimens from southwestern Iran. Moreover, color patterns were different from previous specimens

### کلمات کلیدی:

Gekkonidae, *Hemidactylus persicus*, New record, distribution
