### خلاصه مقاله:

Species of Anurophorus Nicolet, 1842 (Collembola: Isotomidae) mostly occur in forest habitats. They are usually dark in colors and characterised by absence of furca. During 2018, a survey was conducted for Collembola in Mazandaran province (Northern Iran). Some Isotomidae specimens were extracted from soil, moss and decaying wood samples using Berlese funnel. Among the collected samples from family Isotomidae some specimens of Anurophorus silvaticus Potapov & Stebaeva, 1990 were also identified. The species is reported for the first time from Iran. We provide the description, including photos of A. silvaticus based on the Iranian material

### کلمات کلیدی:

Anurophorinae, Biodiversity, Hyrcanian forest, Mazandaran
