## خلاصه مقاله:

The COVID-19 outbreak has led to increasing global concerns about infection control. Amid this pandemic, dentistry could be considered as one of the most high-risk medical sectors for health workers due to the high exposure to patients infected with this deadly virus. After the decline of the steep prevalence of COVID-19 cases, the dental associations have allowed dental offices to reopen under special circumstances by taking the necessary precautions and following the prescribed guidelines to keep both the dentists and their patients safe and healthy during the treatment. The aim of this review is to present a policy to manage and facilitate the dental procedures in the dental practice routine amid coronavirus by focusing on the patients' risk level in order to keep the possibility of COVID-19 transmission to a minimum.

## کلمات کلیدی:

COVID-19, Dentistry, Infection control, Patient risk
