خلاصه مقاله:

Materials and methods: The present study is a mixed study that was conducted in ۲۰۱۹ at Mazandaran University of Medical Sciences. face, content, and construct validity was investigated by exploratory factor analysis and confirmatory factor analysis with the participation of ۳۳۴ managers of hospitals in Mazandaran Province. The reliability of the questionnaire was estimated using internal consistency (Cronbach's alpha) and its stability was estimated through test-retest. **Results:** the primary tool was designed with ۷۵ items and ۲۰ factors. The construct validity of the questionnaire was extracted through exploratory factor analysis leading to the exclusion of ۵ items and ۲۰ factors that explained a total of ۵۹.۰۱% of the total variance. The CFA showed a model with suitable fitness for the data. The reliability of the tool by Cronbach's alpha and ICC were more than ۰.۸۰ and shows the stability of scale. **Conclusion:** Hospital performance evaluation questionnaire using IPOCC approach despite features such as .proper reliability and validity; simple scoring and ease of use is appropriate and its use is recommended
