خلاصه مقاله:

We discuss whether finiteness properties of a profinite group G can be deduced from the coefficients of the probabilistic zeta function $P_G(s)$. In particular we prove that if $P_G(s)$ is rational and all but finitely many non abelian composition factors of G are isomorphic to $PSL(2,p)$ for some prime p , then G contains only finitely many maximal subgroups.

کلمات کلیدی:

Probabilistic zeta function, finiteness conditions, special linear groups
