خلاصه مقاله:

We characterize strictly diagonal type of embeddings of finitary symmetric groups in terms of cardinality and the characteristic. Namely, we prove the following. Let κ be an infinite cardinal. If $G = \bigcup_{i=1}^{\infty} G_i$, where $G_i \cong \text{FSym}(\kappa n_i)$, ($H = \bigcup_{i=1}^{\infty} H_i$, where $H_i \cong \text{Alt}(\kappa n_i)$), is a group of strictly diagonal type and $\langle p_1, p_2, \dots \rangle$ is an infinite sequence of primes, then G is isomorphic to the homogenous finitary symmetric group $\text{FSym}(\kappa)(\langle \xi \rangle)$ (H is isomorphic to the homogenous alternating group $\text{Alt}(\kappa)(\langle \xi \rangle)$, where $n_\infty = 1$, $n_i = p_1 p_2 \dots p_i$).

کلمات کلیدی:

Finitary symmetric groups, Centralizer, Locally finite simple groups
