خلاصه مقاله:

Background and aims: In order to plan for preventing and decreasing the rate of nursing errors, understanding of nurse's perception of nursing errors could be very helpful. This study was thus designed to examine the critical care nurses perception of nursing errors from view point of critical care nurses. Methods: This study was conducted in 9 hospitals in Qazvin province located in north of Iran. Using convenience sampling, all registered nurses who worked in critical care units were invited to participate in the study. Data were collected between January and March ۲۰۱۵ with using "predisposing factors of nursing errors questionnaire". Results: Of ۳۷۹ nurses participated in this study, ۷۷.۸% (N= ۲۱۳) were women. The mean age of participants was 34 ± 2.2 years and mean years of experience was 8.1 ± 1.5 years. Totally, from view of nurses, most and lowest common causes of nursing errors were related to "management aspect" and "Team coordination" items respectively. Conclusion: Nursing educational systems should pay more attention to nurses' perception to nursing errors and may consider their view during planning and education towards decreasing nursing errors in critical care setting.
