خلاصه مقاله:

In the past, principally due to a lack of information, the Italian population was not willing to participate in the post-seismic intervention strategies. Therefore, the National Seismic Service and SGA have developed a national project of information, Arianna, to increase the knowledge on seismic phenomena and stimulate the individual responsibility, thus building a new dialogue between the State and the citizens. The three target groups are operators and technicians, a school-going public and the older population. Respectively, have been constructed a Documentation Centre, which groups over 4 Gbyte of texts, images, films, and MIDI files and so on. It is a CD-ROM, structured on three accesses: chronological, geographical and by journey, and a book-guide, a medium between the Documentation Centre and the territory. The key-idea of the three different means of communication is a journey, which is real as well as virtual, and which goes through space as well as time
