## خلاصه مقاله:

Increasing competitiveness between software companies , that stems from customer needs and new information technologies, obliges the companies to improve their products' quality according to high speed and low cost. This research seeks to introduce and determine the software production assembly line, one of the software development approaches. A three stage questionnaire was used to collect information which was extracted from literature, first stage and assessing the prerequisites of the system consecutively. In analyzing the data, first the Binom test was used and then executive activities were prioritized in two categories; technical management and organizational management. Finally, the relationship among the three stages determined by the relationship matrixes and software .development pattern proposed

## کلمات کلیدی:

Assembly Line Approach, Principal Property, Re-Utilizing, Software Architecture, Software Assembly Line
