خلاصه مقاله:

This investigation deals with multi server queue with balking. The customers arrive in poisson fashion and independent of time, under the assumption that system is initially empty. The number of customers in the system is stochastically increasing and distributed in steady state (stationary state) as required. The expressions for the .measure of the speed of convergence from transient state to steady state probability of system are obtained

کلمات کلیدی:

Multi Server, Poisson, Stochastic, Steady state, Balking
