## خلاصه مقاله:

Two specimens of the Large-toothed Ferret Badger *Melogalepersonata* were found in two different sites from Marshyangdi Rural Municipality, Ward No 4, Srichaur, Tangring, Lamjung district, Nepal. The first individual was live capturing by the local people on 4th January 2017 where the second was found dead on 17th January 2017. The location was  $28^{\circ} 24' 5.04''$  N and  $84^{\circ} 24' 31.68''$  E, which was the border region of Annapurna Conservation about 203 km far from capital city of Nepal, Kathmandu and found in tropical forest along the riverside of Marshyangdi river. The specimens were examined carefully and the confirmation was based on the diagnostic large size of the upper fourth premolar and the relative size of the upper first and second premolars to one another. The species was recorded inside the Annapurna Conservation Area which was very near to the boundary separated by the Marshyangdi River. The distance between the live sighting and the dead individual was 100 m approximately. This account represents the .first authentic record of *M. personata* in the Annapurna Conservation Area moreover in Nepal too
