## خلاصه مقاله:

Contextualism is a symbol for creating a favorable environment. Therefore, more knowledge and awareness and a deeper understanding of the context and environment for architects and designers is necessary and inevitable. The designer and architect must understand the message of the background and context of the design and then design according to the existing conditions. The design should be based on a realistic approach to environmental information, and the building should interact properly with its building in such a way that the architecture is the discovery of the building required by the site, and the architecture and context are mutually reinforcing. This style of architecture is implemented as a style consistent with the context and regional architecture or traditional architecture. In this study, we have examined its most important concepts and presented the results in five principles

## کلمات کلیدی:

Architecture, contextualism, regional
