خلاصه مقاله:

The human resource development of sport as a foundation to achieve record and international success is one of the most priorities of different countries. Economic status and society's health lead to sports participation. Therefore, this study's purpose was to examine the effect of economic status and society's health on the human resource development of organized sports. This study used panel data for all provinces of Iran from ۲۰۰۴ to ۲۰۱۷. Also, this study used generalized least squares approach to analyze data with Eviews software. The result shows that rural and urban household income has a positive and significant effect on the human resource development of organized sports. Also, the consumer price index of health and treatment has a positive and significant impact on the human resource development of organized sports. A society where people have a suitable economic status is more likely to participate in sports. Also, when the cost of health and treatment is low and appropriate, it is possible to have more athletes and coaches

کلمات کلیدی:

.household income, Health, treatment, Human Resource, Organized Sports
