خلاصه مقاله:

A survey of Braconinae wasps was conducted at five sites, represented by various agroecosystems, rangelands and forests in Western Iran (Hamadan province) during ۲۰۱۵-۲۰۱۶ with a series of light and Malaise traps. Fifteen species belonging to three genera (Bracon Fabricius, Glyptomorpha Holmgren and Pseudovipio Szépligeti) were identified, among them five species, viz. Bracon concavus Tobias, B. fumigidus Szépligeti, B. iskilipus Beyarslan & Tobias, B. moczari Papp and B. novus Szépligeti, were recorded for the first time from Iran. ۱۵ species are new provincial records for Hamadan.
