## خلاصه مقاله:

Herceptin is an effective and functional drug created by genetic engineering and is effective in treating certain types of cancer, especially breast cancer. Despite Herceptin's positive uses in cancer treatment, recent studies have shown that the drug may also be effective in preventing the onset of cancer. In addition, Herceptin also plays an important role in reducing the risk of cancer recurrence by stabilizing survival, stabilizing the immune response and inhibiting tumor growth. In this theory, we consider the possible uses of Herceptin to prevent the occurrence of cancer and treat various diseases. This article also reviews the results of research conducted in this area and existing criticisms of the use of Herceptin in cancer. Finally, we will turn our attention to the strengths and weaknesses of Herceptin in the field of cancer prevention and treatment, and consider the drug's future prospects. This article is recommended for .scientists and researchers interested in the field of cancer and anticancer drugs
