خلاصه مقاله:

Introduction: Fracture - dislocations of the talus are typically due to high energy injuries. Displaced fracture - dislocations of the talus have poor outcomes in general and complications are common. Although talar fracture is common and comprises the second most common tarsal fracture, bilateral fracture - dislocations of the talus are rare. Not many reports regarding the subject can be found in the literature. Case Presentation: We report a patient with bilateral fracture - dislocations of the talus treated by open reduction and internal fixation. This patient was a ۲۵ year-old man who sustained bilateral fracture - dislocation of the talus due to a motor vehicle accident. Conclusions: Bilateral talar fracture - dislocation is rare. The surgical approach discussed together with the pathomechanics of this injury can yield good short term results.
