خلاصه مقاله:

This study was carried out at the Razi Institute during ۲۰۰۵-۲۰۰۶ with inspecting ۱۲۱۶۸ lung tissue of slaughtered sheep and goats at the Ziaran Abattoir. Pneumonia were diagnosed in ۲۸۲ cases and the affected lung tissue was collected and transferred to the Bacteriology and Pathology Departments for isolating of *Pasteurella* spp. and interpretation of histopathologic lesions. *Pasteurella multocida* was isolated from ۱۲۰ cases. Histopathology sections indicated purulent bronchopneumonia ۰.۵۱%, purulent interstitial bronchopneumonia ۰.۱۷%, purulent bronchitis / bronchiolitis ۰.۱۲%, purulent pleuritis / pleuropneumonia ۰.۰۷%, purulent fibrinous bronchopneumonia ۰.۰۴%, purulent pneumonia ۰.۰۹% and progressive pneumonia ۰.۰۱%. Statistical analysis of data showed that the frequency of outbreak in the various seasons was significantly different in sheep (P
