خلاصه مقاله:

An odontome is a slow growing and non-aggressive odontogenic tumor composed of enamel, dentin, cementum and pulp tissue. complex odontome comprise of an unorganized mass of odontogenic tissues, morphologically not resembling the normal teeth. in this report, a case of rare odontoma in a ten-years-old boy that caused delayed eruption of a maxillary right first permanent molar, buccal expansion of the alveolar plate and a swelling on the palatal surface of this tooth is presented. after consultation with the department of orthodontics and regarding the radiographs of the area, it was decided to extract the tooth. during careful extraction of the tooth just an irregular overlying mass of hard tissue was removed. at this stage, no attempt was made to completely extract mentioned tooth. histological examination revealed that the hard tissue was a complex odontoma. 3 months follow-up resulted in complete resolution of the swelling and eruption of the tooth which reached to the occlusal plane.

کلمات کلیدی:

complex odontoma, odontoma, first permanent molar, Delayed eruption
