خلاصه مقاله:

Stomach ulcers are caused by the loss of the protective lining of the stomach due to excessive secretion of stomach acid. This acid will cause ulcers in the stomach, which in acute cases are accompanied by pain, severe inflammation and bleeding. Gastrointestinal pain is a painful physical condition that, if left untreated, can disrupt a person's daily life. Stomach ulcer is one of the common types of digestive pain, which fortunately can be treated now, but it should be taken seriously. Because this disease does not have a high mortality rate, but due to its relatively high prevalence (about ۱۵%), it affects a person psychologically, socially and economically. The human digestive system is made up of different parts, each of which may suffer from different causes. Stomach ulcer is one of the common diseases of the digestive system that can affect the normal life of people. This disease is known as stomach ulcer due to its symptoms. In this article, we discuss the symptoms of this disease and how to manage it

کلمات کلیدی:

Stomach, treatment, stomach ulcer, disease
