خلاصه مقاله:

BACKGROUND AND AIM: Sucking of some types of a pacifier may be a risk factor for mal-development of orofacial structures and malocclusion. This study assessed the prevalence of using of different types of pacifier and bottle nipple among ۱-۲۴ months old children in Kerman, Iran. **METHODS:** In this cross-sectional study, a total of ۳۰۰ mothers interviewed at ۲۰ specialized private pediatric offices in Kerman. The mothers had ۱-۲۴ months old children. A checklist includes items about pacifier sucking, bottle feeding habits, as well as mothers' ability to recognize different kinds of available pacifier and bottle nipple was used. **RESULTS:** The rate of pacifier-sucking was ۳۷.۳%, and use of bottle feeding was ۴۲.۳%, and among of the users, ۲۴.۰ and ۳۵.۷% were used orthodontic (functional) types of pacifier and bottle nipple respectively. However, only ۲۸.۷% of mothers had adequate ability to recognize orthodontic pacifier and bottle nipple. **CONCLUSION:** The rates of using orthodontic kind of pacifier and bottle nipple were low, and a few mothers had adequate ability to recognize their differences.
