خلاصه مقاله:

The security of wireless sensor networks is a fundamental issue in many practical applications. The purpose of this paper is to present a method for the failure of denial of service attacks and the continuity of the performance of wireless sensor networks to increase security with the possibility of identifying the attacker. Different types of different active layers in a WSN. Two types of machine learning techniques, neural network (NN), support vector machine (SVM), detect media access control (MAC) layer attacks. This network has a wireless sensor node access channel, MAC. It is necessary to create a protective layer.

کلمات کلیدی:

Wireless sensor networks, security services, denial of service attack
