خلاصه مقاله:

ZnO nanohemispheres are successfully synthesized via thermal decomposition approach using [bis(2-hydroxy-1-naphthaldehydato)zinc(II)] complex, as precursor. The final ZnO nanoparticles were characterized by X-ray diffraction (XRD), scanning electron microscopy (SEM), transmission electron microscopy (TEM), Fourier transform infrared (FT-IR) spectroscopy, and photoluminescence (PL) spectroscopy. Furthermore, the same solid phase thermal treatment is performed and the morphology is compared with the obtained ZnO nanohemispheres

کلمات کلیدی:

Thermal decomposition, Zinc oxide, capping agent, inorganic precursors
