خلاصه مقاله:

Studies of ICZM in performed process are made up of 3 steps: Step one: performing studies in basics and data of main base Step two: segregation of studies in to partial fields and explanation of them in result-oriented format Step three: deduction of studies for providing the synthetic document of Iran's ICZM project The following article is encompassing the methodology of third step (synthesizing) in which the results of thematic studies are represented due to synthesizing and spatial objectives and guidelines of integrated management in a multistep model. [1] In above methodology, at first we have an overview on related global experiments [2], then common issues that were studied due to their manner of zoning or style of spatial regulations application are modified and surveyed in a triple approach of conservative (which emphasizes on retaining the natural and environmental values), development oriented (with focus on sustainable use of resources), and problem oriented (with the idea of removing the existing problems and oppositions) as a result. [3] During the above studies, zoning were elected as a substantial tool for pursuing the objectives, spatial guidelines and policies, and therefore makes possibilities for planners to apply the considered regulations. The ability to make spatial objectives and guidelines of development and conservation is another premium of zoning. As zoning represents a flexible structure to planners, they can precise their policies in a spatial format and [limit or intensify the developments in some cases. [4

کلمات کلیدی:

synthesizing of studies, methodology, spatial zoning, conceptual model
