## خلاصه مقاله:

society health Rapid, on time, and cheap accessibility to these centres in any society is highly Health and treatment centres are places directly engaging in provision of individual and important and necessary especially in urban communities. Allocated share for each person is 0.04 meter in region number 2 in Zahedan which shows a distinct difference in comparison with standard situation. Human judgments and interpretations play an important role in finding location of health centers. Therefore, the more decision is engaged with human opinion and complex systems, the more dominance fuzzy phenomenon has on its description. Although AHP for location finding has advantages with other approaches, it has some weaknesses. Using fuzzy approach , weaknesses can be minimized .In this research ,we investigate three health centers with criteria of body , economic, communicative, and natural ones in order to find the best center .MATLAB software is used to the research operation due to high amount of calculation in FAHP

## کلمات کلیدی:
