خلاصه مقاله:

Management of infectious diseases such as vaginitis in women that cause stress and result in high health care costs and costs In most cases, most commonly Candida albicans, and is. Factors such as contraceptives and intrauterine devices may also increase susceptibility to the disease. This study examined the risk factors and clinical findings in women with vaginal candidiasis was conducted. The study included 051 women who were in the control group. Questionnaires to obtain demographic information, symptoms, management, prevention of pregnancy, mode of delivery and the use of LVL Hey rinse was used. Using the t-test and chi-square test and Naparamn Whitney test using SPSS 05 data were examined. This study showed that Candida albicans strains isolated from patients were Ghalb Tryn. Unlike some studies QrsHay between contraceptive use, method of delivery and Candida Vaginitis caused significant relationship was found. However, the wash solution Vaginitis vaginal infection have shown a significant relationship. The most common symptoms are itching and discharge can be tested in people dilute aqueous noted. Based on the results, only one candidate can not be based on symptoms, diseases and culture can help doctors diagnose the condition is diagnosed. Also, with regard to the management of drug resistance in infected .individuals for further study and evaluation of these patients is recommended in various parts of the country
