خلاصه مقاله:

The paper deals with the differentiation of mental health level between first stage and advance stages of cancer patients, including inpatients and outpatients of Bharat Cancer Hospital and Research Institute of Oncology, Mysore, India (2006). The aim of the study was to assess mental health among two stages of cancer patients. The data were collected from 30 first stage cancer patients and 30 fourth stages (advanced) of cancer patients and who included male and female, married and unmarried patients available. General Health Questionnaire (GHQ28) including four subscales (Somatic symptoms, Anxiety, Social dysfunction and Depression) was used to assess mental health. The results revealed that there was significant difference in all subscales between first stage and advanced stage of cancer patients. present study establish that the cancer stage position can be influence of cancer patients' mental health, in other word the mental health of cancer patients depending to stage of cancer, can be alter
