خلاصه مقاله:

This paper presents a comparative study carried out on the physical-chemistry properties based within the Density Functional Theory (DFT) in the metal complexes (Li, Na, and K). To this end, this study set out to evaluate energy values of the Highest Occupied Molecular Orbital (EHOMO), the Lowest Unoccupied Molecular Orbital (ELUMO), the gap (ΔE), Ionization Potential (IP), Electron Affinity (EA), global Hardness (η), electronegativity (χ), Chemical Potential (μ), global softness (σ), electrophilicity
