خلاصه مقاله:

The developments of the past few years have made theoretical linguists interested in the potentials of bilingual speech for the theory of language. The problem area which has attracted the largest number of studies relates to the question of whether bilingual children possess a single system for their languages or two different systems are at work. A possible answer to this question can be found by looking at the language use of bilingual children regarding their language mixing. Bilingual children's code mixing in correlation with a variety of linguistic elements has been explored to find the reasons for such a phenomenon. Code mixing used to be taken as an argument in favor of the Unitary Language System Hypothesis. However, recent studies questioned the validity of this hypothesis and argued that code mixing is a normal part of bilingual development, and bilingual children have good reasons to code mix. Since there are certain limitations in these studies, further investigation seems to be necessary.

کلمات کلیدی:

Bilingualism, Code mixing, Code switching, Language learning, Unitary Language System Hypothesis
