خلاصه مقاله:

Increasing costs and competitions, cause manufacturers to seek cheaper materials or ones with a more desirable price, and to find more optimized generating processes. On the other hand, appearing laws concerning security and environment care will greatly affected the composition of detergents such as phosphate and surfactants. So recent actions in this regard has led to higher quality of detergents , and as a result lower amounts of materials consumed , that economically brings with it the lower energy consumption and therefore the preservance of environment . Today , consumer prefer want the detergents to cleanse clothes and to preserve then as well , which can be obtained through some recently known materials like zeolite . This study introduces some zeolite used in purifying industry moreover, it . gives a series of properties of a cleaning zeolite , and presents factors influencing the purifying power of this

کلمات کلیدی:

Detergant, A-type zeolite , ion-exchange
