خلاصه مقاله:

Oral cancer is the largest group of the head and neck cancer category. Worldwide incidence is exceeding 640,000 cases annually. It is estimated that in year 20d6, 48,000 people in the US will be newly diagnosed with oral cancer. There are two distinct pathways by which most people come to oral cancer. One is through the use of tobacco and alcohol, a long term historic problem and cause, and the other is through exposure to the HPV virus. Other factors such as age, genetic susceptibility have an important role in developing oral cancer. If oral cancer is detected in early stage, prognosis will be significantly better than those detected in later stages. Therefore, we emphasize on prevention and early detection of oral cancer. In this presentation oral cancer epidemiology, pathology, risk factors, and prevention will be discussed.
