خلاصه مقاله:

Breast cancer is the most common cancer that women are affected. In Western countries it is more common in women over 50 years of age, but in our country patients are younger and in many cases due to lack of awareness of symptoms in patients who have advanced stages. It should be noted that no matter how breast cancer is detected early, treatment is easier, more successful and less costly for the patient and the insurance organizations too. According to studies mammography is the best and most accurate diagnosis and screening method. If the woman has not breast problem, for early diagnosis the first mammography should be done at the age of 35-39 years. In western countries with regard to disease incidence and available resources, Mammography should be done in 40-49 years every 1-2 years and then to 65 years and depending on the doctor's opinion done every year. According to previous studies, the most cause of the lack of Iranian women for mammography has been the high cost. Since most of the cost, pay the patient in the form of out of pocket which is expensive for the majority of society. Cooperation with insurance pay a larger share of this amount. is not only effective health equity but also the interest of insurance organizations. The data showed that the cost of mammography is 900,000 rials in mammography center that the insurance organization should pay only 280,000 rials and the remaining 620,000 rials will be paid by the patient in the form of out of pocket. Review the medical expenses to the surgery are as follows. Price of mastectomy, about 15,000,000 million rials that comes with at least two days in hospital with hoteling 2,700,000 Rials per night will be equivalent to 20,400,000 rials. That the insurance does not pay the 8,992,000 That the insurer pay only 899,200 rials. If that is the patient in low stage and looking early mammography detected. In contrast, patients who are diagnosed late will have to do a mastectomy or radical mastectomy, The cost of mastectomy was 25,000,000 rials, Meanwhile, the need for a longer stay in hospital for at least three days hoteling hospital added to this amount, That is a total equivalent to 33,100,000 rials. The amount of the share of the insurer exceeds 15,238,000 rials. Radical mastectomy is spending more and more stay. Surgery cost in this case is 28,000,000 rials. Which, along with at least four days in hospital would be equal to 34,984,000 rials and the insurer must pay the amount of 17,984,000 rials. On the other hand if the insurance organizations pay the premium to the 50% of mammography cost, including 20 patients for mammography in the early detection of a mastectomy, Paid ... by the insurance (20,984,000 + 9,000,000 would be 21,884,000 rials)
