خلاصه مقاله:

Population growth and urbanization increases the need to provide housing in day-to-day. In the United States nearly 8 million people are working in the building industry. The number of accidents and injuries is higher in this industry from all industries except manufacturing industries. Working conditions in the industry somewhat predictable hazards. The rate of accidents in the industry is 50% higher than other industries. Over one million deaths annually required for construction activities on the environment. This figure is close to 30% of all accidents and occupational accidents. In Iran, in 1391 the number of special events over five thousand cases have been registered. The identification and prevention of accidents must be radically with respect safety principles. The most important causes of accidents is unsafe acts and conditions. More than 90 per cent of accidents are caused due to unsafe actions. Being different stages in the construction industry as safety has led to complexity. This study aimed to review practices and library, Which uses different sources to discuss safety and collection of the construction industry s safety rules and regulations

کلمات کلیدی:

construction, safety, accidents
