## خلاصه مقاله:

Pleomorphic adenoma or benign mixed tumor is the most common tumor type in salivary gland. PA is uncommon in the breast tissue. Only 73 cases of PA of breast reported in the world literature. We are reporting 74th case of PA of the breast. A 61 year old woman referred to shahid beheshti hospital obstetric clinic with bloody painless discharge from right nipple. Bean size mass was detected right below the right nipple. In microscopic view the pathologist found proliferation in epithelial and myo-epithelial cells that had small and multi nuclei. Myxoid and chondroid stroma could be seen. Immune-histo-chemistry stain was positive for S-100 and patchy for GFAP 15 in tumor cells and for SMA around the tubule-glandular and tumor cell aggregates, and confirmed the diagnosis of the first pathologist. It's essential for the pathologists to consider PA of the breast as a differential diagnosis of a round circumscribed mass in juxtaareolar areas. And careful paraffin sections should be performed for unnecessary mastectomy.
