## خلاصه مقاله:

years than ever in the past. Management of the axilla in breast cancer patients has evolved from routine axillary lymph node dissection (ALND) for all patients to a highly selective approach based on the assessment of the sentinel lymph nodes (SLNs) as well as tumor and patient characteristics. Although ALND continues to have an important role in staging and regional control for many breast cancer patients, recent trial results question the need for routine ALND in patients who have positive SLNs. Approximately 40 percent of patients with a positive sentinel lymph node (SLN) will be found to have residual disease in the axilla
