## خلاصه مقاله:

The concept of Social Determinants of Health (SDH) emerged in public health literature during an evolutionary process in our collective knowledge of determinants of health.1 The World Health Organization (WHO) defines SDH as conditions in which people are born, grow, work, live, and age, and the wider set of forces and systems shaping the conditions of daily life which include economic policies and systems, development agendas, social norms, social policies, and political systems.2 Although its root goes back to before Alma Ata declaration, but even within WHO, it was not paid attention for years.3
