خلاصه مقاله:

Traditional community utilization was a major element of forest destruction. To this study Havare-Khol forest in the Baneh region, Kurdistan province in the west of Iran was selected. Distance from Havar Khol village divided to three classes include; less 500, 500 – 1000 and more 1000 meter. In each classes inventory 20 square sample plots 20 m by 20 m (400 m²) by randomized–systematic method. In each sample plot Diameter at Breast height (more 1 cm), Height, Crown cover recorded. ANOVA test used to camper the mean tree parameter in the distance classes. Results showed that by increases distance from village mean of tree parameter increases. Forest destruction in the near of Havare Khol village higher the more distance from village. Anova test showed the different between mean tree characteristic in the distance from village classes was significant. To sustained forest management of Havare Khol village suggested to use Agroforestry plan in the near of village and conservation planning focused in the near of .village

کلمات کلیدی:

Agroforestry, Havare Khol village, Baneeh region, Distance from village
