خلاصه مقاله:

Pathogenic agent of avian Influenza identified as Influenza virus type A of orthomixoviridea family which is considered as an important economic and hygienic issue. Therefore discussing and finding solutions to intervene with infection assumed so essential. This article discussed about comprehensive and functional methods used for controlling the avian influenza. This study revised the results of more than 52 books and national/international articles. Prevention, management and eradication consider as three final results in controlling the disease. These results would be achieved by performing five related solutions together: correction in education like communication behavior changes, biosafety such as breeding, sales, cleaning, disinfection, avian movement management, care and diagnosis, polluted avian elimination and reduce the sensitivity of host after vaccination. Achieving goals for controlling the disease depend on country, subtype of virus, economical situations and general hygiene can be different, but it has to be noticed that there is no just one method to control the avian influenza and therefore, combinational methods should be used.
