خلاصه مقاله:

Sustainable transport policies seek to find ways to provide decent access for all segments of society, moderate economic costs and reduce environmental pollution. On the other hand, the current experiences of intra-urban transport in our country and the continuation of the existing process have little bearing on the sustainable transport perspectives. Through intelligent transport systems, the traffic problems can be greatly improved and the effects of using it in Quality of life, preventing environmental degradation, reducing costs, and wasting time. One of the sustainable ways of sustainable development is the use of sustainable transport, which in the world today needs to use the services offered by ITS.
