**خلاصه مقاله:**

Background and Aim : There is no accurate data on the prevalence of elder abuse in Iran unknown and few studies have been done in this area. Methods : This prospective cross-sectional study was performed on 300 old subjects aged over 65 years referred to the Emergency Department of three Imam Hossein, Loghman Hakim, and Tajrish Hospitals in Tehran. Results : The present study identified three components of emotional neglect, psychological abuse and financial abuse as three important subscales of elder abuse. Conclusion : Since elder abuse can affect the elderly's mental and physical health, more attention needs to be paid to the issue of elder abuse.

**کلمات کلیدی:**

Abuse, neglect, elderly population
